

Revision Change Log

Human Patience and AI Frustration

Revision principle: all unaffected original PDF content was retained. Only evidence-required phrases or paragraphs were replaced, and new model/limitations pages were inserted.

Location	Exact type of change
Title	Changed causal "affect" wording to relational wording and corrected "Users Trust" to "Users' Trust."
Abstract	Replaced the abstract results paragraph so it reports the 204-to-181 exact-content rule and the rebuilt H1-H4 conclusions.
Design and research question	Changed isolated "experiment/effect" wording to "scenario-based survey/relationship" without changing the hypotheses.
Data Cleaning and Analysis Plan	Removed the duplicated switch-away sentence and added the exact deduplication rule, Friedman/Wilcoxon tests, H2 comparisons, logistic models, odds ratios, confidence intervals, and qualitative caveat.
Participant wording	Changed "181 unique responses" to "181 unique response-content patterns."
Rebuilt model section	Inserted four pages containing the H1 Friedman and paired tests, H2 mixed comparison, H3 logistic/directional analyses, H4 logistic/category analyses, and scale sensitivity.
Frustration composite	Changed "adequate" alpha wording to marginal exploratory internal consistency and documented construct overlap.
Written responses	Relabeled formal qualitative themes as illustrative comments because no formal coding protocol was supplied; original quotations were left unchanged.
Discussion opening	Reframed the verification shift as an interpretation rather than an observed mechanism.
H1 discussion	Retained support for H1, changed "confirms" to "is consistent with," and corrected Lazar et al. from 2004 to 2006.
H2 discussion	Changed the conclusion from somewhat supported to mixed and added the conflicting forced-choice and paired-rating results.
H3 discussion	Changed supported to partially supported and added the any-change, directional, and asymmetric-item results.
H4 discussion	Kept H4 but changed the conclusion to not supported; added OR = 1.08, 95% CI [0.84, 1.38], $p = .565$, and separated the conceptual action types.
Limitations	Changed remaining experiment wording, clarified multiple-response platform percentages, and inserted a page covering order, confounding, self-report, identity, cleaning, minors/ethics reporting, scale overlap, and qualitative limitations.
Conclusion	Replaced the conclusion with an evidence-aligned H1 supported / H2 mixed / H3 partial / H4 unsupported summary and removed causal verification-shift language.
AI transparency	Changed singular/plural authorship wording and disclosed statistical-model and revision-formatting assistance.

Models rebuilt

The models were rerun from the supplied Excel response rows after exact-content deduplication. The companion workbook contains the full audited values, confidence intervals, pairwise contrasts, logistic sensitivity models, item diagnostics, and source links.

No original respondent-level open-text material was added to the model workbook.
